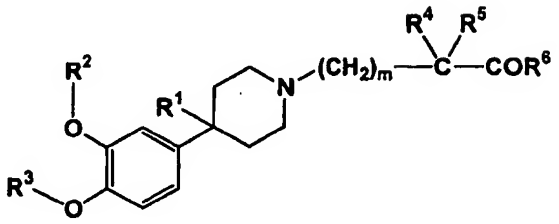
Description

TECHNICAL FIELD

[0001] The present invention relates to piperidine derivatives.
More specifically, the present invention relates to

(1) piperidine derivatives represented by formula (I):



(I)

(wherein all symbols have the same meanings as described below), or nontoxic salts thereof,
(2) a process for preparing thereof, and
(3) an agent comprising thereof as an active ingredient.

BACKGROUND ART

[0002] Cyclic adenosine 3',5'-monophosphate (cAMP) and cyclic guanosine 3',5'-monophosphate (cGMP) as intracellular signal transduction molecules (second messengers) are degraded by a group of hydrolases generally called phosphodiesterase (PDE) into inactive 5'-AMP and 5'-GMP, respectively.

[0003] PDE isozymes which inactivate them are not uniformly present *in vivo* but distributed *in vivo* having an organ-specific localization by showing differences, e.g., in cell distribution and tissue distribution.

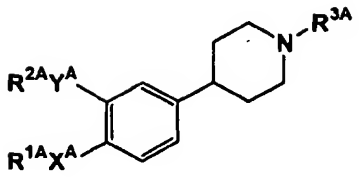
[0004] Up to date, the presence of 11 families of PDE1 to PDE11 has been confirmed (see *Current Opinion in Cell Biology*, 12, 174-179 (2000)).

[0005] Among these PDEs, PDE4 is present in various cells such as airway smooth muscle cells, epitherial cells, inflammatory cells (macrophages, neutrophils and eosinophils) and T lymphocytes, and controls cellular functions by regulating the intracellular cAMP level of these cells. On the other hand, other PDEs such as PDE5 are present in, e. g., platelets, cardiac muscle cells and vascular smooth muscle cells and participates in the control of circulatory organ system by regulating intracellular cGMP or cAMP level.

[0006] Thus, it is known that PDE4 inhibitors have bronchodilatory activity, anti-inflammatory activity, mediator release inhibitory activity, immunosuppressive activity and the like, because they cause accumulation of intracellular cAMP by inhibiting degradation of cAMP by PDE4.

[0007] Accordingly, it is considered that agents which specifically inhibit PDE4 do not show the activities of other PDE inhibitors such as PDE5 upon circulatory organs and are useful in preventing and/or treating various diseases such as inflammatory diseases (e.g., asthma, obstructive lung disease, sepsis, sarcoidosis, nephritis, hepatitis, enteritis, *etc.*), diabetic diseases, allergic diseases (e.g., allergic rhinitis, allergic conjunctivitis, seasonal conjunctivitis, atopic dermatitis, *etc.*), autoimmune diseases (e.g., ulcerative colitis, Crohn's disease, rheumatism, psoriasis, multiple sclerosis, collagen disease, *etc.*), osteoporosis, bone fracture, obesity, depression, Parkinson's disease, dementia, ischemia-reperfusion injury, leukemia and AIDS (*Exp. Opin. Invest. Drugs*, 8, 1301-1325 (1999)).

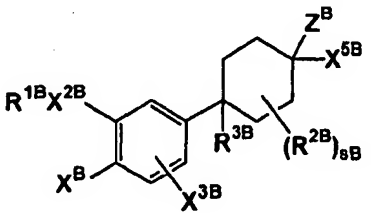
[0008] As the PDE4 inhibitors, for example, the specification of JP-T-8-509731 discloses that a compound represented by formula (A):



(A)

(wherein R^{1A} represents H or C1-6 alkyl; R^{2A} represents C3-7 alkyl, C3-7 cycloalkyl, *etc.*; D^{3A} represents COR^{4A}, $COCOR^{4A}$, *etc.*; R^{4A} represents H, OR^{5A}, NHOH, *etc.*; R^{5A} represents H, C1-6 alkyl, *etc.*; X^A represents O, *etc.*; and Y^A represents O, *etc.*) or a pharmaceutically acceptable salt thereof has a PDE4 inhibitory activity (necessary parts were extracted from the description of groups).

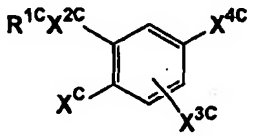
[0009] Also, the specification of WO 93/19747 discloses that a compound represented by formula (B):



(B)

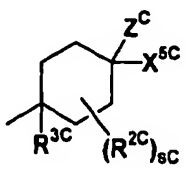
(wherein R^{1B} represents $-(CR^{4B}R^{5B})_{rB}R^{6B}$; rB is 1 to 6; R^{4B} and R^{5B} each independently represents a hydrogen atom or a C1-2 alkyl group; R^{6B} represents a hydrogen atom, a C3-6 cycloalkyl group, *etc.*; X^B represents Y^BR^{2B}, *etc.*; Y^B represents O, *etc.*; R^{2B} represents methyl, ethyl, *etc.*; X^{2B} represents O, *etc.*; X^{3B} represents a hydrogen atom, *etc.*; sB is 0 to 4; R^{3B} represents a hydrogen atom, CN, *etc.*; X^{5B} represents a hydrogen atom, *etc.*; Z^B represents $CR^{8B}R^{8B}C(O)OR^{14B}$, $CR^{8B}R^{8B}C(Y^B)NR^{10B}R^{14B}$, *etc.*; R^{8B} a hydrogen atom, *etc.*; R^{10B} represents a hydrogen atom, OR^{8B}, *etc.*; and R^{14B} represents a hydrogen atom, *etc.*) or a pharmaceutically acceptable salt thereof has a PDE4 inhibitory activity (necessary parts were extracted from the description of groups).

[0010] Also, the specification of WO 93/19749 discloses that a compound represented by formula (C):



(C)

(wherein R^{1C} represents $-(CR^{4C}R^{5C})_{rC}R^{6C}$, etc.; rC is 1 to 6; R^{4C} and R^{5C} each independently represents a hydrogen atom or a C1-2 alkyl group; R^{6C} represents a hydrogen atom, a C3-6 cycloalkyl group, *etc.*; X^C represents Y^CR^{2C}, *etc.*; Y^C represents O, *etc.*; R^{2C} represents methyl, ethyl, *etc.*; X^{2C} represents O, *etc.*; X^{3C} represents a hydrogen atom, *etc.*; X^{4C} represents



etc.; R^{3C} represents a hydrogen atom, CN, *etc.*; X^{5C} represents a hydrogen atom, *etc.*; sC is 0 to 4; Z^C represents C(O)OR^{14C}, C($Y^{'C}$)$NR^{10C}R^{14C}$, *etc.*; R^{10C} represents a hydrogen atom OR^{8C}, *etc.*; R^{8C} represents a hydrogen atom, *etc.*; and R^{14C} represents a hydrogen atom, *etc.*) or a pharmaceutically acceptable salt thereof has a PDE4 inhibitory activity (necessary parts were extracted from the description of groups).

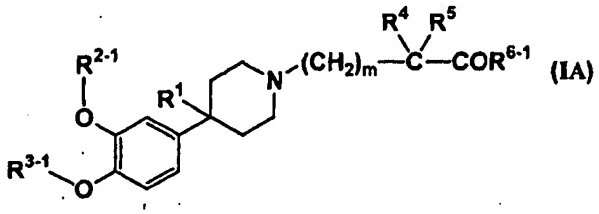
[0032] The compound of the present invention represented by formula (I) can be prepared by the following methods or methods described in Examples.

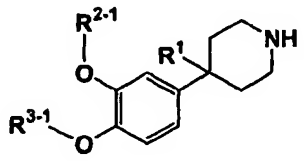
[1] Among the compounds of the present invention represented by formula (I), a compound in which R^6 represents a C1-8 alkoxy group or a C1-8 alkyl group substituted with a phenyl group; and $-OR^2$ and $-OR^3$ do not represent a hydroxyl group, i.e., a compound represented by formula (IA):



(IA)

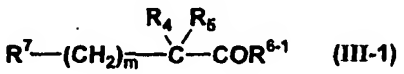
(wherein R^{6-1} represents a C1-8 alkoxy group or a C1-8 alkyl group substituted with a phenyl group; $-OR^{2-1}$ and $-OR^{3-1}$ have the same meanings as $-OR^2$ and $-OR^3$, with the proviso that they do not represent a hydroxyl group; and other symbols have the same meanings as described above) can be prepared by the following methods a) to c).

a) The compound represented by formula (IA) can be prepared by reacting a compound represented by formula (II-1):



(II-1)

(wherein all symbols have the same meanings as described above) with a compound represented by formula (III-1):

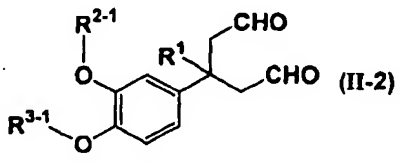


(III-1)

(wherein R^7 represents a leaving group (e.g., a halogen atom, a trifluoromethylsulfonyloxy group, a mesyloxy group or a tosyloxy group), and other symbols have the same meanings as described above).

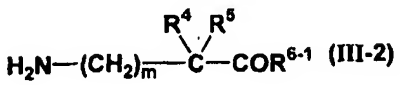
Reaction of the compound represented by formula (II-1) with the compound represented by formula (III-1) is known. For example, it is carried out at 0 to 100°C in an inert organic solvent (e.g., dimethylformamide, dimethyl sulfoxide, chloroform, methylene chloride, diethyl ether, tetrahydrofuran, acetonitrile, *etc.*) in the presence of a base (e.g., potassium carbonate, calcium carbonate, sodium carbonate, cesium carbonate, triethylamine, pyridine, 2,6-lutidine, *etc.*).

b) The compound represented by formula (IA) can be prepared by reacting a compound represented by formula (II-2):



(II-2)

(wherein all symbols have the same meanings as described above) with a compound represented by formula (III-2):

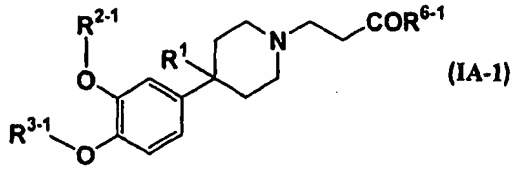


(III-2)

(wherein all symbols have the same meanings as described above).

Reaction of the compound represented by formula (II-2) with the compound represented by formula (III-2) is known. For example, it is carried out in a mixed solvent of an inert organic solvent (e.g., dimethylformamide, dimethyl sulfoxide, chloroform, methylene chloride, dichloroethane, diethyl ether, tetrahydrofuran, acetonitrile, *etc.*) with acetic acid in the presence of a reducing agent (e.g., sodium triacetoxyboron hydride ($NaBH(OAc)_3$), sodium cyanoboron hydride ($NaBH_3CN$), *etc.*) at 0 to 100°C.

c) Also, among the compounds represented by formula (IA), a compound in which m is 1 and R^4 and R^5 each represents a hydrogen atom, i.e., a compound represented by formula (IA-1):



(IA-1)

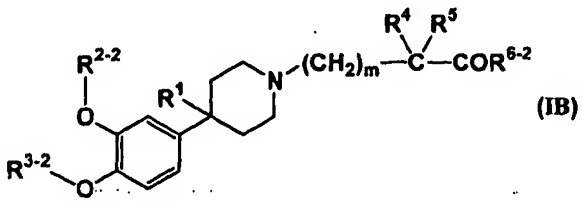
(wherein all symbols have the same meanings as described above) can be prepared by reacting the compound represented by formula (II-1) with a compound represented by formula (IV):

(IV)

(wherein all symbols have the same meanings as described above).

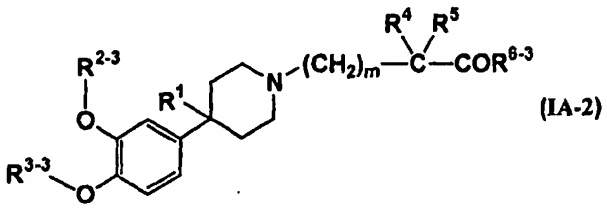
Reaction of the compound represented by formula (II-1) with the compound represented by formula (IV) is known. For example, it is carried out in an inert organic solvent (e.g., dimethylformamide, dimethyl sulfoxide, chloroform, methylene chloride, diethyl ether, tetrahydrofuran, acetonitrile, *etc.*) in the presence of a base (e.g., potassium carbonate, calcium carbonate, sodium carbonate, cesium carbonate, triethylamine, pyridine, 2,6-lutidine, *etc.*) at 0 to 100°C.

[2] Among the compounds of the present invention represented by formula (I), a compound in which at least one of $-COR^6$, $-OR^2$ and $-OR^3$ represents a carboxyl group or a hydroxyl group, i.e., a compound represented by formula (IB):



(IB)

(wherein -COR^{6-2}, -OR^{2-2} and -OR^{3-2} have the same meanings as -COR^6, -OR^2 and -OR^3, with the proviso that at least one of them represents a carboxyl group or a hydroxyl group; and other symbols have the same meanings as described above) can be prepared by subjecting a compound among the compounds of formula (IA) prepared by the above methods in which -COR^{6-1}, -OR^{2-1} or -OR^{3-1} represents a carboxyl group or a hydroxyl group protected with a protecting group, i.e., a compound represented by formula (IA-2):



(IA-2)

(wherein -COR^{6-3}, -OR^{2-3} and -OR^{3-3} have the same meanings as -COR^6, -OR^2 and -OR^3, with the proviso that at least one of them represents a carboxyl group or a hydroxyl group protected with a protecting group; and other symbols have the same meanings as described above) to a deprotection reaction of the protecting group.

Examples of the protecting group of a carboxyl group include a methyl group, an ethyl group, a t-butyl group, and a benzyl group.

Examples of the protecting group of a hydroxyl group include a methoxymethyl group, a 2-tetrahydropyranyl group, a t-butyldimethylsilyl group, a t-butyldiphenylsilyl group, an acetyl group, and a benzyl group.

The protecting groups of a carboxyl group and a hydroxyl group are not particularly limited to the above, and other groups can also be used, so long as they can be easily and selectively released. For example, those which are described by T.W. Greene in *Protective Groups in Organic Synthesis*, 3rd edition, Wiley, New York, 1999, can be used.

The deprotection reaction of these protecting groups of a carboxyl group and a hydroxyl group is known, and examples include

(1) a deprotection reaction under alkaline conditions,
(2) a deprotection reaction under acidic conditions,
(3) a deprotection reaction by hydrolysis,
(4) a deprotection reaction of a silyl group, and the like.

These methods are specifically described below.

(1) The deprotection reaction under alkaline conditions is carried out, for example, in an organic solvent (e.g., methanol, tetrahydrofuran, dioxane, dimethylformamide, *etc.*) using an alkali metal hydroxide (e.g., sodium hydroxide, potassium hydroxide, lithium hydroxide, *etc.*), an alkaline earth metal hydroxide (e.g., barium hydroxide, calcium hydroxide, *etc.*) or a carbonate (e.g., sodium carbonate, potassium carbonate, *etc.*), an organic amine (e.g., triethylamine, diisopropylethylamine, piperazine, *etc.*) or a quaternary ammonium salt (e.g., tetrabutylammonium fluoride, *etc.*) or an aqueous solution thereof or a mixture thereof at a temperature of 0 to 40°C .

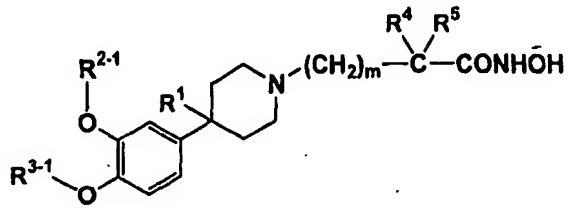
(2) The deprotection reaction under acidic conditions is carried out, for example, in an organic solvent (e.g., methylene chloride, chloroform, dioxane, ethyl acetate, anisole, *etc.*) using an organic acid (e.g., acetic acid, trifluoroacetic acid, methanesulfonic acid, *etc.*), an inorganic acid (e.g., hydrochloric acid, sulfuric acid, *etc.*) or a mixture thereof (e.g., hydrogen bromide/acetic acid, *etc.*) at a temperature of 0 to 100°C.

(3) The deprotection reaction by hydrolysis is carried out, for example, in a solvent, such as an ether system (e.g., tetrahydrofuran, dioxane, dimethoxyethane, diethyl ether, *etc.*), an alcohol system (e.g., methanol or ethanol), a benzene system (e.g., benzene, toluene, *etc.*), a ketone system (e.g., acetone, methyl ethyl ketone, *etc.*), a nitrile system (e.g., acetonitrile, *etc.*), an amide system (e.g., dimethylformamide, *etc.*), water, ethyl acetate, acetic acid or a mixed solvent of two or more of them, in the presence of a catalyst (e.g., palladium-carbon, palladium black, palladium hydroxide, platinum oxide, Raney nickel, *etc.*) under ordinary or forced pressure in an atmosphere of hydrogen or in the presence of ammonium formate at a temperature of 0 to 200°C.

(4) The deprotection reaction of a silyl group is carried out, for example, in an organic solvent miscible with water (e.g., tetrahydrofuran, acetonitrile, *etc.*) using tetrabutylammonium fluoride at a temperature of 0 to 40°C.

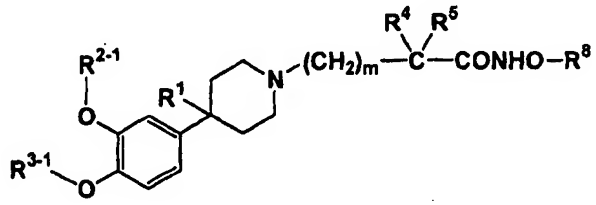
Although it can be easily understood by those skilled in the art, an objective compound of the present invention can be easily prepared by properly using these deprotection reactions.

[3] Among the compounds of the present invention represented by formula (I), a compound in which R^6 represents -NHOH; and $-OR^2$ and $-OR^3$ do not represent a hydroxyl group, i.e., a compound represented by formula (IC):



(IC)

(wherein all symbols have the same meanings as described above) can be prepared by subjecting a compound represented by formula (V):



(V)

(wherein R^8 represents a protecting group of hydroxamic acid; and other symbols have the same meanings as described above) to a deprotection reaction.

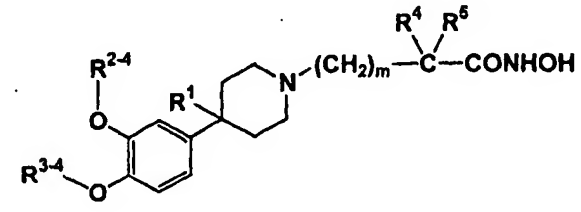
The protecting group of hydroxamic acid includes a t-butyl group, $-C(CH_3)_2-OCH_3$, a benzyl group, a t-butyldimethylsilyl group and a tetrahydropyran-1-yl group, but other groups can also be used without particular limitation so long as they can be easily and selectively released. For example, those described by T.W. Greene in *Protective Groups in Organic Synthesis*, 3rd edition, Wiley, New York, 1999, can be used.

Deprotection reactions of these protecting groups of hydroxamic acid is known, and examples include

(1) a deprotection reaction under alkaline conditions,
(2) a deprotection reaction under acidic conditions,
(3) a deprotection reaction by hydrolysis,
(4) a deprotection reaction of silyl group, and the like.

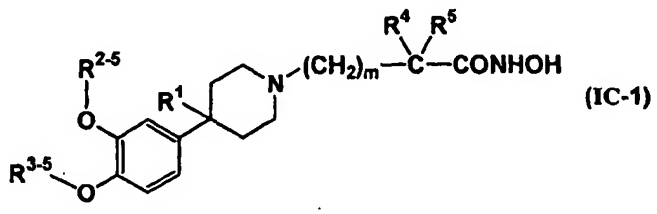
These reactions can be carried out by the same methods described above.

[4] Among the compounds of the present invention represented by formula (I), a compound in which R^6 represents -NHOH; and at least one of $-OR^2$ and $-OR^3$ represents a hydroxyl group, i.e., a compound represented by formula (ID):



(ID)

(wherein -OR^{2-4} and -OR^{3-4} have the same meanings as -OR^2 and -OR^3, with the proviso that at least one group thereof represents a hydroxyl group; and other symbols have the same meanings as described above) can be prepared by subjecting, among the compounds of formula (IC) prepared by the method described above, a compound in which -OR^{2-1} or -OR^{3-1} represents a hydroxyl group protected with a protecting group, i.e., a compound represented by formula (IC-1):



(IC-1)

(wherein -OR^{2-5} and -OR^{3-5} have the same meanings as -OR^2 and -OR^3, with the proviso that at least one of them represents a hydroxyl group protected with a protecting group; and other symbols have the same meanings as described above) to a deprotection reaction of the protecting group.

[0033] The deprotection reaction of a protecting group can be carried out by the methods described above.

[0034] The compounds represented by formulae (II-1), (II-2), (III-1), (III-2), (IV) and (V) are known compounds or can be prepared easily by known methods.

[0035] For example, the compounds represented by formulae (II-1), (II-2) and (V) can be prepared by the methods shown by the following Reaction Schemes 1 to 3.

[0036] In the reaction schemes, Me represents a methyl group; Et represents an ethyl group; Boc represents a t-butoxycarbonyl group; Ms represents a mesyl group; LiHMDS represents lithium hexamethyldisilazane; TFA represents trifluoroacetic acid; and other symbols have the same meanings as described above.

[Pharmacological Effects]

[0039] The PDE4 inhibitory activity of the compounds of the present invention represented by formula (I) was confirmed by the following tests.

In vitro enzyme assay:

Test methods:

[0040] U937 cells (originated from human monocyte) were cultured in PRMI 1640 medium containing 10% fetal bovine serum. The U937 cells were harvested and homogenized in 20 mM Tris-HCl buffer [pH 8.0, containing PMSF (1 mM), leupeptin (1 μg/ml) and pepstatin A (1 μg/ml)]. After centrifugation (at 15,000 rpm for 10 minutes), the supernatant was recovered and filtered through a 0.45 μm filter. The sample was applied to MonoQ (manufactured by Pharmacia, strong anion exchange resin) column and eluted by a density gradient of 0 to 0.8 M NaCl. Fractions from which the PDE activity was disappeared by 10 μM rolipram (a PDE4-selective inhibitor) were recovered and used as the enzyme solution for the measurement of PDE4 inhibitory activity.

[0041] The enzyme activity was measured by the following method. 80 μl of a diluted enzyme solution (in phosphate buffer (pH 7.4) containing 0.1 mg/kg bovine serum albumin), 10 μl of a solution of the compound of the present invention (in 10% DMSO) and 10 μl of ^{3}H-cAMP (20,000 cpm, 10 μM) [in an imidazole buffer (100 mM, pH 7.5) containing $MgSO_4$ (100 mM) and bovine serum albumin (1 mg/ml)] were mixed and incubated at room temperature for 30 minutes. The reaction was stopped by treating the reaction solution for 2.5 minutes in a microwave oven. After centrifugation (at 2,000 rpm for 1 minute), 10 μl of snake venom (1 mg/ml, manufactured by Sigma, trade name V7000) was added and incubated at room temperature for 30 minutes. To an alumina column (100 μl), 50 μl of the supernatant was applied, eluted with 80 μl of 0.005 N hydrochloric acid, and radioactivity of the eluate was measured.

[0042] PDE4 inhibitory activity ratio of the compound of the present invention was calculated by the following equation:

PDE4 inhibitory activity ratio (%)

= (1 - radioactivity in the presence of the compound of the present invention/

radioactivity in the absence of the compound of the present invention) x 100

[0043] The IC_{50} value was calculated on each compound as a concentration of the compound of the present invention which inhibits 50% of the PDE4 activity.

[0044] The test results are shown in Table 11.

TNF-α production inhibitory activity:

[0045] A heparinized blood sample collected from a healthy person was dispensed in 180 µl/well into a 96-well plate. A solution of the compound of the present invention (final concentration of DMSO: 0.1% or less) was dispensed at 10 µl and the plate was allowed to stand at 37°C for 30 minutes in a 5% CO_2 incubator. The reaction was initiated by adding 10 µl of LPS solution. After 6 hours of incubation in a CO_2 incubator (5% CO_2, humidified), the plate was shaken and then centrifuged at 300 x g for 5 minutes to recover 50 µl of the supernatant (blood plasma). The amount of TNF-α in the supernatant was measured using a human TNF-α ELISA kit (DIACLONE Cat. No. 850.090.096) in accordance with the method attached thereto. As a result, the compound of the present invention showed a dose-dependent inhibitory activity.
